

How to accurately determine your horse's body weight

Knowing your horse's weight helps you make better decisions about your horse's health including feeding routines, de-worming dosages and more

With a flexible 120" tape measure, measure your horse's heart girth and body length and then use the formulas indicated below.

Heart Girth: Measure around the horse's girth by placing tape across the highest part of the withers and keeping the tape as close behind the elbows as possible.

Body Length: Use two people to measure from the point of the shoulder, straight back along the horse's side to the point of the buttock.

Formulas:

Adult Horse: (Heart Girth x Heart Girth x Body Length) ÷ 330 = Bodyweight

Yearling: Divide by 301 instead of 330

Weanling: Divide by 280 instead of 330
